

The Global warming is getting worse every year, mostly because the using air-conditional in everyone's house, even you have those thermos carafe the heat still will be wasted. In this house, there is no need of the air-conditional. The front part of the house the western style, using all wood builds, in order to the house cool and the pool do the same thing (usually used in summer). The second part of the house is eastern style, using modern plank and add Insulation Refractory, in order to make the room warm (usually used in winter)

Energy and water treatment is the important content of environmental protection.

Energy-saving insulation wall: and roof. Increase the exterior insulation layer, qualified and roof insulation to meet or exceed the requirements of national standard, can significantly reduce the consumption of building.

Water treatment: through biochemical pool (through the test methods such as processing), but after the sewage directly into your pond fish and plants by natural purification again, ponds to environmental emissions standards later. Save the central treatment brings huge investments.
