

My dream home is constructed to overlook the city of Pittsburgh. The house will be made out of three levels of staggered recycled shipping containers. The staggering of the containers begins with the basement level. This level will be mostly underground but partially coming out of the hill to extend onto a large patio. The basement will house a movie theatre, and all sorts of games, ie. pool tables. The patio will have an outdoor kitchen and bar and will have a great view of the cityscape. The next floor will be the main floor. This will hang over the patio just slightly and will have all the essentials a regular house would have. It will house the kitchen, living space, laundry room, master bedroom and bath, a separate room and bathroom, and a dining area. The top floor will be a pool house sort of area. About half of the container will be taken up by a hull holding the water for the pool that will be on the roof. This level will contain a guest bedroom, a couple of showers, and a small lounging area. This floor will extend over the remaining part of the basement patio. On the roof will be a full sized pool that will have an amazing view of the Pittsburgh City. All of the appliances in the house will be recycled, and there will be solar panels on site to power the house. It will certainly be a good help in keeping the earth safe.
